Diet

Dunedin beef and veal feed on grass paddocks and drink pristine water in the New Zealand countryside. In addition to their pasture, cattle have access to non-GMO barley, alfalfa hay and meadow hay. The Dunedin diet gives the meat a robust flavour.

Traceability

Dunedin cattle are traceable from birth to plate.

BSE-Free

New Zealand Farms are BSE and Foot and Mouth Disease free.

Environmental Practices

New Zealand Farmers practice GAP and environmentally sustainable agriculture. New Zealand farmers keep their pastures healthy by adhering to the following practices.

- Limit the number of cattle on each pasture to avoid overgrazing.
- Ensure that all pasture is completely covered.
- Create shelter belts to protect the land from wind erosion and frost.
- Rotate cattle among many pastures.
- Provide supplementary feed.
